

# Api needs to create in dev.thepride.app

1. driver api for number of ride which is completed daily weekly monthly

i will send u request param count of ride

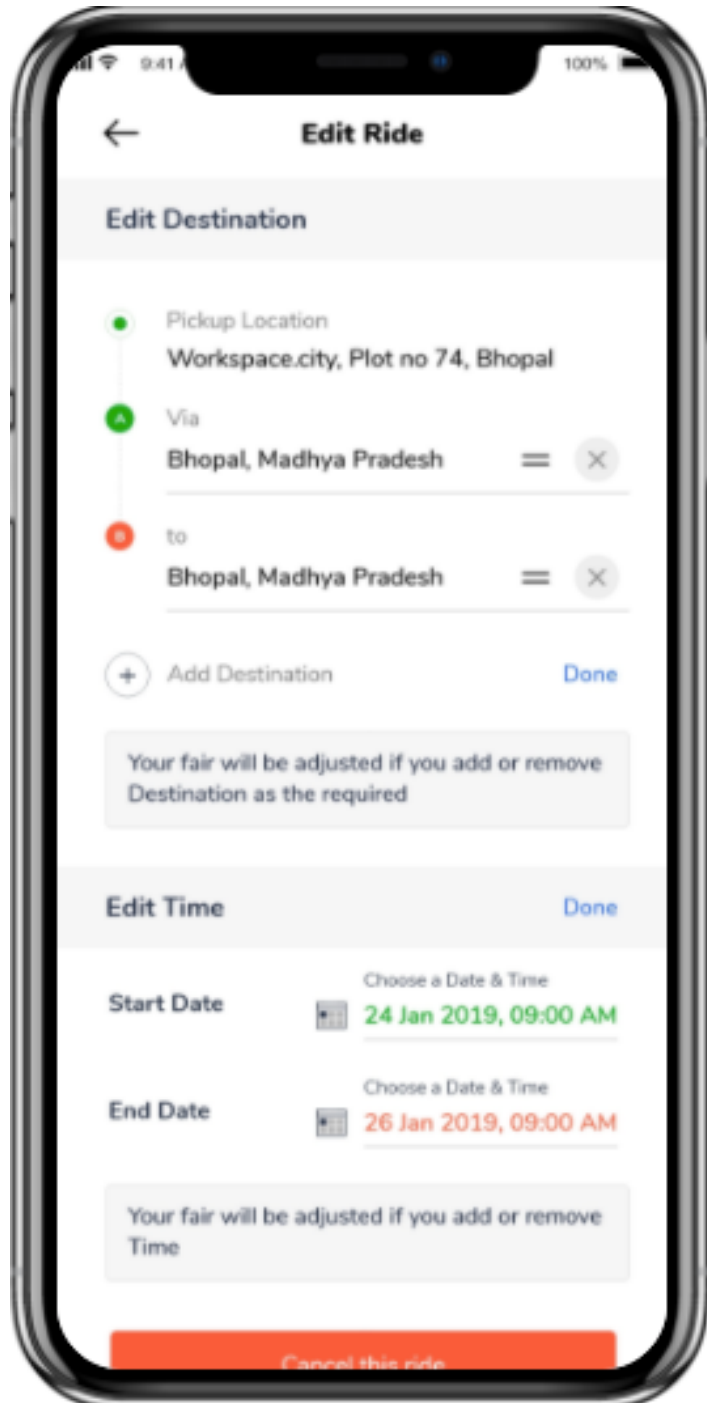

parameter name filter = daily then u have to written all information of ride which has been served by that driver

check this screen for your understanding .

like i need details in which date then no of rides and total amount of all those rides for daily monthly and weekly .

for this screen we need to create one update ride api in which we will send u param of send request api again with changed thing like source destination and all so u have to update that trip in user\_request table and have to send us revised fair estimate in response .

then please do work on mobile number login as discussed .

## **api/provider/trip?**

this is trip api of provider and i think same for user as well in its response we need all data like user details driver details fair details service type details in both user and driver and amenities details like price image and name .

and pankaj if u can check how to get distance travelled in ongoing ride then that will be helpful.
